SOP_Energy technology

First of all I am looking forward to achieve my academic and personal goals during my education period. However, it is not that I want my mind to be filled with a life supply of knowledge rather I want to apply all my knowledge and the principle that I gain during my academic time in the benefit of the mankind and the nation where I was born.

Regarding the academic qualification .I have completed my school leaving certificate and higher secondary school in year 1998 and 2000 respectively with first class division in science stream. After completion of my higher secondary education I started helping my father in his business and later decided to continue my study so I decided to study further in the field of Biotechnology so I moved to Bangalore. I competed my under graduation as well as my post graduation from the Bangalore university in the year 2007 with the first class division During my graduation time I have undergone the projects in the plant tissue culture and the medical pathology.

Bio-energy technology is the application of various principles and the technology in the various field of biology to produce the energy in the usage of very minimal amount of financial and the manpower. With the application of the Bio energy technology many wastage and garbage that comes from the humankind and the industry can be used to generate the energy. Wind energy is available in nature in the free of cost this energy can be utilized in the production of the electricity energy. Similarly the waste and the garbage can be utilized in the production of the Bio gas which is used in the cooking and generating electricity thus it makes not to depend fully in the fossils fuel which create the environmental pollution .More over Bio energy technology helps the nature and it s surrounding pollution free. So there is the vast requirement of Bio energy technician.

Our country is land locked country so it has fully depend upon other countries for the source of energy and due the population growth the world's energy sources is getting depleting day by day at the exponational rate already the world is facing the problem regarding the sources of energy, the gradual depletion of fossil fuels, future energy crisis and over exploitation of Bio resources have made man to resident himself and search for alternative energy resources. Nature is rich treasure of energy. The solar energy is efficiently trapped and stored in plants and in turn energy is flow is directed to animal system. Several attempts have been made to exploit natural resources to tap bio energy. The effective utilization of micro organisms and waste biomass for the production of bio energy are some of the land marks in biotechnology. The contribution of Methanaogenic bacteria in waste management enables us to solve environmental problems. So there is always need of the alternate sources of energy and the answer to this is Bio energy production .there is plenty of waste materials available which can be converted into the some or other kind of the energy with the help of some microbes present in the nature. All this is possible only when the person gets the modern and scientific education.

Nature has been the fascinating topic for me from my childhood so I had taken science as the main subject. Always I wonder about the nature and the creatures living in this earth. Only getting the education is not enough in this highly competitive world all we need is to implement this knowledge in the proper channel. For this I have been searching in the internet where I can get the knowledge which gives me teaches me how to be more practical rather than only theoretical. I found Finland as the final destination to do my further study and I found the choice of my subject too in this country too.

Finland is one of the countries in the world which has already getting lots of popularity for the proper utilization of the microbes for the bio energy production and it has got the vast climatic diversity which enables the person to know the nature and its proper utilization. So I have decided to study my master degree in bio energy production and more over the Education of Finland is globally recognized .Due to the political unstability and deproving education in Nepal I have decided to study in Finland.

Learning process is always challenging and I am ready to accept all the challenge that I come across during my study and stay period in the university.

As I am very much aware that the quality of education is assured so students can get excellent as well as accredited education which is globally acceptable as well as Education system is based on ECTS (European Credit Transfer System) so one can transfer s/he credit all over the world. My dream and labor will be rewarded to study such a country where Low Crime rate and peaceful countries as well as kind people and equal rights for national and international students and the educational system that is fully based on practical which is globally acceptable.

Finally, as I know the university education is free due to the government fund so that I should be very much aware on that investment towards my investment and I have do much better than the expectation and also I am fully aware that my course run with the system of self funding so that me and my family background of economic status is fully capable to bear for my lodging and fooding in the period of my study and I am fully aware regarding the requirement of my chosen course of study and for more information I can be contacted on the given below number.

Thanking you
